WinFax automation through Access 97

see WFxRpt_d.mdb

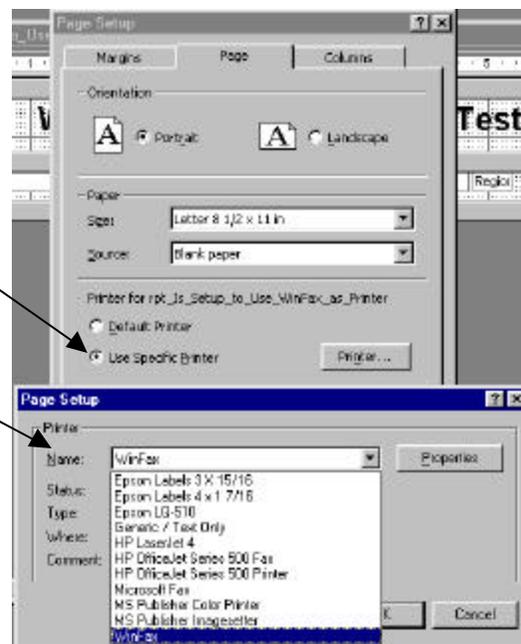

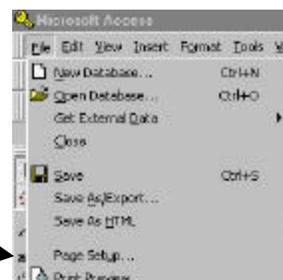

You must have WinFax 8.03 or 9.x for the above to work

To Fax with WinFax from Access take the following steps

#1 You must set the report to print to the WinFax print driver.

A) You can do this at design time.

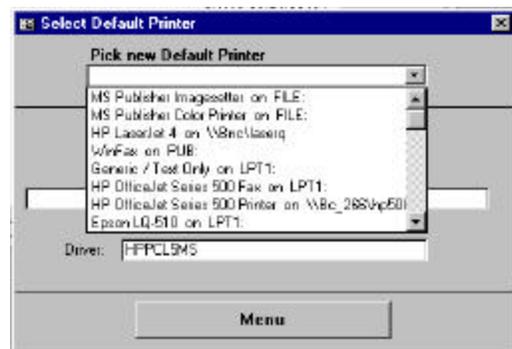

- * File | Page Setup
- * Click "Use Specific Printer" on the page tab
- * Then pick the WinFax printer

B) You can do it at run time. Have the printer set to default printer, then change to WinFax before you print and back to the default after you print.

See code in:

frm_Complex_Fax_Report_WinFax (see pages 5 to 7)
and frm_zs_DefaultPrinter

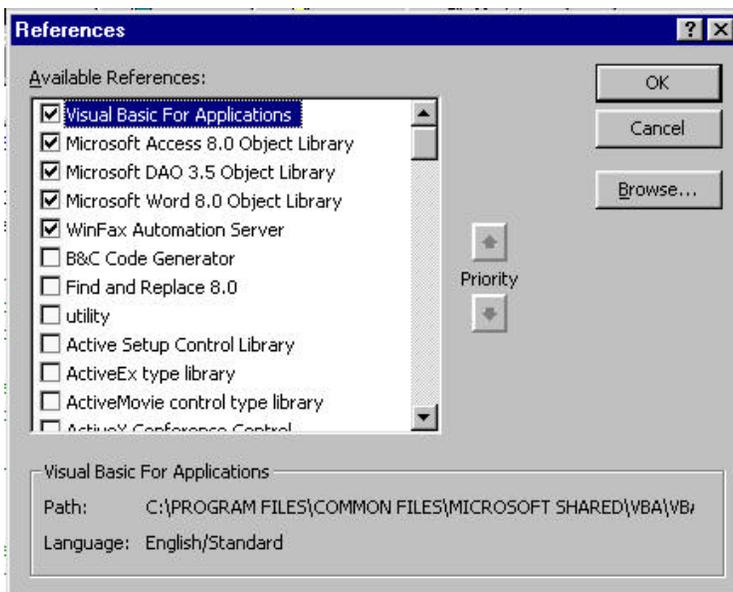

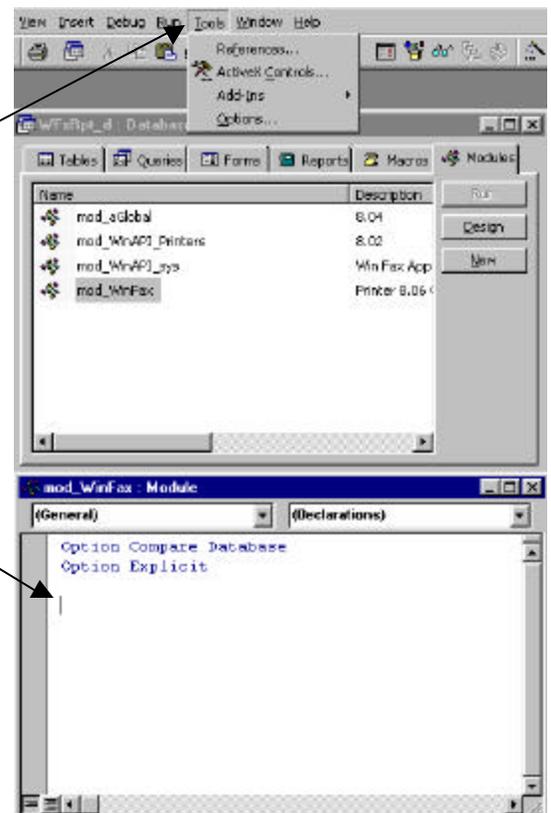

#2 Send WinFax the report (through Automation / SDK), who it's faxed to and the fax number (There is a lot more you can do, but this is the minimum.)

For the forms to work in this mdb take the following steps

#1 Make sure you have WinFax 8.03 or 9.x loaded on your computer.

#2 Make sure Reference is marked - WinFax Automation Server

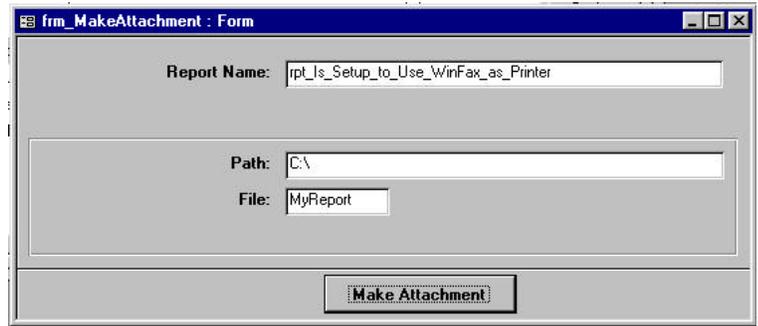

- A) Go to modules
- B) Click any module.
- C) Click the Design button on the database window
- D) Click inside the module.
- E) Go to the menu Tools | References
- F) The below form will come up
- G) Make sure WinFax Automation Server is checked
(It should be towards the bottom of the list)
You will only see it if WinFax 8.03 or 9.x is installed.

Functionality of this database

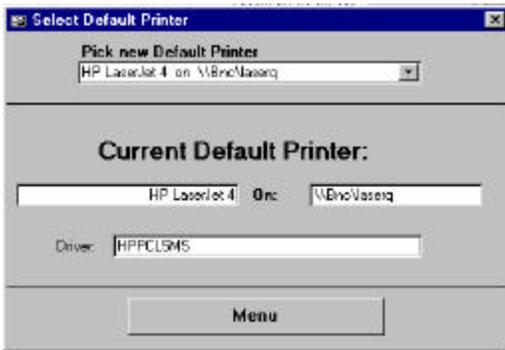

#1 Form: frm_MakeAttachment

- A) This form will make WinFax attachments out of Access reports.
- B) In the below example we create an attachment called
 - * MyReport001.FXS for page 1
 - * MyReport002.FXS for page 2 etc

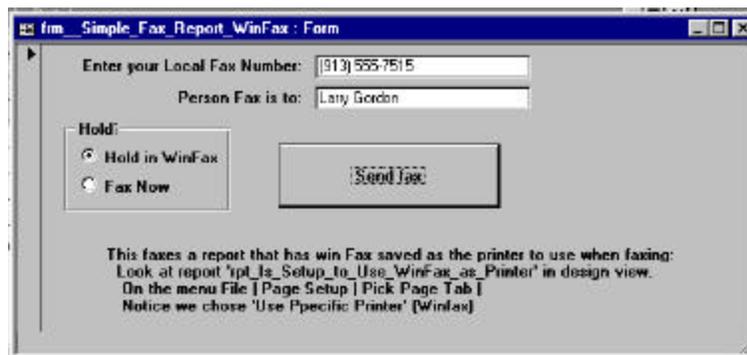

#2 Form: frm_zs_DefaultPrinter

- A) This form will reset the default printer.
- B) There will be times when WinFax will lock and your user will need to reset the default printer.

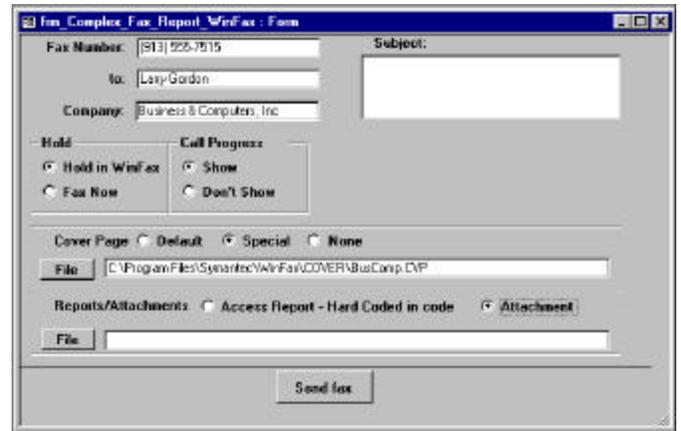

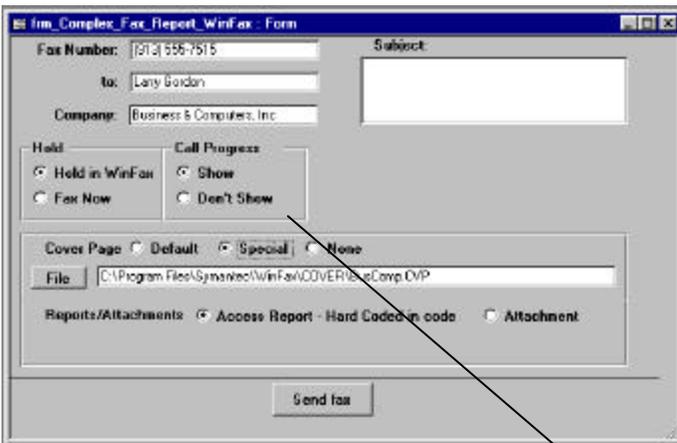

#3 Form: frm_Simple_Fax_Report_WinFax.

- A) The report this form sends (rpt_Is_Setup_to_Use_WinFax_as_Printer) is set to WinFax when it was designed.
- B) We send the report to the typed in fax # and name through WinFax.
- C) You can hold in WinFax or fax now.

#4 Form: frm_Complex_Fax_Report_WinFax

- A) The report this form sends (rpt_Is_Setup_to_Use_Default_Printer) is set to the default printer. The report can be used for a standard report, and when we fax it, in code we change it to the WinFax print driver.
- B) We send the below to the typed in fax # and person and company through WinFax.
- C) Send the above report with or without a cover page.
- D) Send a Word, Excel, or other document, with or without cover page.
(You need to check out what file types works with WinFax. There is no list I'm aware of.)
- E) You can hold in WinFax or fax now.
- F) You can show the WinFax progress screen when faxing.
- G) You can send the subject on the cover page.

#6 Form: frm_SendMultipleReports

- A) This form will let you send faxes with Access and WinFax even if you don't know VBA. If your a macro user - we have taken care of things for you.
- B) Below are the steps for a macro user. If you are a coder in VBA you can figure it out.

AA) Key Word

BB) Report Name

CC) Query to Count

DD) Query to put in table

EE) Id Field

1) Create a report with a query. Create the query for the report, that could be limited by an ID. An example would be sending invoices to companies. If you limited the report by Customer ID only the invoices for a particular company will show.

(Attach the report to Use Specific Printer, WinFax)

u Put the report name in the Control source(design view) of the control. (See BB)

2) Make a query that would delete all records in

“tbl_z_WinFax_Batch”

See query “qry_FaxGroup_Stp1”

3) Make a query that would put 1 record in the table

“tbl_z_WinFax_Batch” for each report you want to send. Note you will need to put a 0 in Deliver by way of. (I use the code to send e-mail or fax).

See query “qry_FaxGroup_Stp2”

4) Make a query that would count the number of faxes to be sent. See query “qry_FaxGroup_Stp3”.

u Put the query name in the Control source (design view) of the control. (See CC)

4) Make a query that would show all the records and fields in “tbl_z_WinFax_Batch”, sorted in the order you want the faxes to print to WinFax. It might be the same query in #4 above. See query “qry_FaxGroup_Stp3”.

u Put the query name in the Control source (design view) of the control. (See DD)

5) Make a macro called “mcr_WinFax1” That would run the queries in step 2 and 3 above. See current macro “mcr_WinFax1”

6) Youre ready to go. The program will go through the query in step 4 above. It will put the report id in the form (See EE above). It will then print the report to WinFax for that Id using the names and fax numbers in the query. It will then go to the next record and do the same thing.

7) I recommend you hide (visible = no) Controls AA to EE in the form.
